Iceberg A-68D Calves off Iceberg A-68A in the South Atlantic Ocean

18DEC20, Suitland, MD — The U.S. National Ice Center (USNIC) confirmed a new iceberg has calved from the A-68A iceberg in the South Atlantic Ocean. This iceberg, named A-68D, is located at 55°5' South, 37°23' West. The iceberg measures 10 nautical miles on its longest axis and 5 nautical miles on its widest axis. A-68D was confirmed by USNIC Master Ice Analyst Chris Readinger using the MODIS image shown below.

Iceberg names are derived from the Antarctic quadrant in which they were originally sighted. The quadrants are divided counter-clockwise in the following manner:

A = 0-90W (Bellingshausen/Weddell Sea) C = 180-90E (Western Ross Sea/Wilkes Land)
B = 90W-180 (Amundsen/Eastern Ross Sea) D = 90E-0 (Amery/Eastern Weddell Sea)

When first sighted, an iceberg's point of origin is documented by USNIC. The letter of the quadrant, along with a sequential number, is assigned to the iceberg. For example, C-19 is sequentially the 19th iceberg tracked by USNIC in Antarctica between 180-90E (Quadrant C). Icebergs with letter suffixes have calved from already named icebergs, where the letters are added in sequential order. For example, C-19D is the 4th iceberg to calve off the original C-19 iceberg.
